DETAILED ACTION

Response to Amendment

Claims 14 and 15 are currently pending. Claims 1-13 and 16 are cancelled.
 Claims 17-28 are withdrawn from consideration as being drawn to non-elected invention. Claims 14 and 15 do overcome the previous 102 rejection. However, claims 14 and 15 stand rejected under the following 103 rejection.

Drawings

2. The drawings filed on 5/25/06 are accepted by the examiner.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 14 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Uchida et al (US 6057051) in view of Margiott et al (US 6093500). The Uchida reference teaches a system for generating and providing fuel cell data to a processing system comprising: a hydrogen storage unit "5"; a fuel cell "2" coupled to hydrogen storage unit; voltage, current, pressure and temperature sensors for sensing fuel cell characteristics and for providing sensor signals indicative of fuel cell characteristic to a

Art Unit: 1745

controller; a control unit "9" coupled to fuel cell for determining fuel cell parameter values in accordance with sensed fuel cell characteristics; a processor in the computer connected to the fuel cell system comprising a fuel indicator such as the pressure sensor in the hydrogen storage unit; a method of detecting the flow rate of the hydrogen which would be a flow meter coupled between hydrogen storage unit and fuel cell for measuring fuel consumption and providing a fuel consumption signal indicative of consumed amount of fuel to control unit; a controller that is coupled to processor via equipment connection terminal, determines a remaining amount of fuel in fuel cell in accordance with consumed amount of fuel, determines a remaining amount of fuel cell power in accordance with remaining amount of fuel, determines an electrical consumption rate being consumed by computer operating system in accordance with a sensed electrical current provided by fuel cell to processor, transmits values indicative of remaining amount of power and electrical consumption rate from fuel cell to a computer operating system residing in processing system via equipment connection terminal, and a processor that determines an amount of time for fuel cell to provide power to associated computer operating system in accordance with transmitted values indicative of remaining amount of power and electrical consumption rate. In addition, it also teaches an operating system that renders the amount of remaining time via processor (See column 5, line 54 to column 6, line 6 and column 7, lines 39-58). However, the reference does not expressly teach a data bus that couples the controller to the processing system and transmits values indicative of remaining amount of power and electrical consumption rate from fuel cell to a computer operating system residing in Art Unit: 1745

the processing system. The Margiott reference teaches a data bus "80" that connects the controller "56" to the processor "62" and transmits fuel cell data from the controller and other devices that part of the fuel cell system to the processor (See column 6, lines 12-15 and Figure 1). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the Uchida fuel cell system to include a data bus that couples the controller to the processing system and transmits values indicative of remaining amount of power and electrical consumption rate from fuel cell to a computer operating system residing in the processing system in order for the processor to change the operating state of the fuel cell such as during shut down of the system when the amount of fuel in the fuel tank is low.

Response to Arguments

5. Applicant's arguments with respect to claims 14 and 15 have been considered but are most in view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tony Chuo whose telephone number is (571) 272-0717. The examiner can normally be reached on M-F, 8:30AM to 5:00PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Ryan can be reached on (571) 272-1292. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
